

## What is a Firewall?

A **firewall** is a physical device that resides between the Internet and your private computer(s). The purpose of a firewall is to prevent unauthorized access to your confidential data and information.

## Why do I need a Firewall?

Having a hardware-based firewall is the single best way of preventing attacks from the Internet. In addition, new Federal regulations mandate the protection of Patient and Employee confidential information. **(HIPPA)**

## About I.S. Sentry

**We understand the complication** involved in securing computers. We also know the research and dedication necessary to keep on top of the latest security threats.

I.S. Sentry was born out of continuous requests from doctors, lawyers, and other professionals to protect their computers from the onslaught of security threats originating from the Internet. Our team has over 25 combined years of experience doing just that!

Let our team of specialists eliminate the burdensome task of becoming a security expert. Spend your time on the task of improving your business.

## Hardware Firewall

**I.S. Sentry offers state-of-the-art** hardware-based Firewalls with VPN technology using the latest encryption standards. Continuously updated against an ever growing number of threats, be confident that your computers are protected from the Internet.

**Hardware Firewalls help** protect against intruders connecting to your computer(s) from the Internet. Websites are available with downloadable tools allowing a hacker to bypass standard security in mere seconds.

**If you are bound by HIPPA regulations**, you could be held personally responsible if confidential patient, employee, or client information is "leaked" out. Worse yet, a malicious hacker could permanently damage your computer(s) for the sheer fun of it. Trojans, Virus, and Worm programs are increasing in popularity and making computers more susceptible to attack.

## Trojan/Virus/Worm

**Trojan: A destructive program** that pretends to be useful but instead causes harm on the computer it infects. Similar to a virus, a Trojan does not propagate itself to other computers.

**Virus: A program that** infects a computer by attaching itself to another program and replicates when that program is run. While some viruses are pranks, others have malicious payloads including destruction of files or completely corrupting a hard drive.

**Worm: A program that can make** copies of itself and quickly spread through computer networks using email clients such as Outlook. Risk can be deleted files or total deletion.
